

Abstract

[Abstract]

There are provided a storage section 16 for storing transmitted electronic mails and received electronic mails, respectively; a control section 19 for detecting
5 electronic mails exchanged with a party designated by an operation section 6 from the electronic mails stored in the storage section 16; and a display section 1 for displaying in time sequence and in list form the electronic mails exchanged with the other party detected by the control section 19. Thus, the electronic mails transmitted to and received from the designated party can be displayed while being mixed in time
10 sequence and in list form, whereby the manner in which the electronic mails have been exchanged with the other party becomes clearly understood at a glance.
